

# api fallback

```
1 def ip_bilgisi(ip):
2     apis = [
3         f"https://ipinfo.io/{ip}/json",
4         f"https://ipapi.co/{ip}/json/",
5         f"http://ip-api.com/json/{ip}"
6     ]
7
8     veri = {}
9
10    for url in apis:
11        try:
12            r = requests.get(url, timeout=5).json()
13
14            if "city" in r or "region" in r or "country" in r:
15                veri = r
16                break
17        except:
18            continue
19
20    return f"""
21    IP: {ip}
22    Ülke: {veri.get("country") or veri.get("country_name")}
23    Şehir: {veri.get("city")}
24    Bölge: {veri.get("region")}
25    ISP: {veri.get("org") or veri.get("isp")}
26    Saat Dilimi: {veri.get("timezone")}
27    """
```

this code will try 3 https url to request if you have an problem with json you can try this.
